Membrane copper amine oxidase (EC 1.4.3.6) (Vascular adhesion protein-
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   the mouse vascular adhesion protein-1 gene and promoter.",
J. Immunol. 161:2953-2960(1998).
-!- FUNCTION: Cell adhesion protein that participate in lymphocyte recirculation by mediating the binding of lymphocytes to peripheral lymph node vascular endothelial cells in an L-selectiningependent fashion. Has a monoamine oxidase activity.
-!- CATALYTIC ACTIVITY: RCH(2)NH(2) + H(2)O + O(2) = RCHO + NH(3) +
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 SIGNAL-ANCHOR (TYPE-II MEMBRANE PROTEIN)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Bono P., Salmi M., Smith D.J., Leppanen I., Horelli-Kuitunen N., Palotie A., Jalkanen S.;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           COPACTOR: Binds 1 copper ion and 1 topaquinone per subunit. SUBUNIT: Homodimer (By similarity).
SUBCELLULAR LOCATION: Type II membrane protein.
PTM: Topaquinone (TPQ) is generated by copper-dependent autoxidation of a specific tyrosyl residue (By similarity).
PTM: N- and O-glycosylated (By similarity).
SIMILARITY: Belongs to the copper/topaquinone oxidase family.
                                                                                                                                                                                                                                              Mus musculus (Mouse).

```

- -!- FUNCTION: This magnesium-dependent enzyme catalyzes the hydrolysis of APP coupled with the translocation of calcium from the cytosol to an endomembrane compartment.
 -!- CATALYTIC ACTIVITY: ATP + H(2)O + Ca(2+) (Cis) = ADP + phosphate +
- Ca(2+)(Trans).
 SUBCELLUIAR LOCATION: Integral membrane protein.
 SUMILARITY: Belongs to the cation transport ATPases family (P-type ATPases). Subfamily IIA.

Hong C.C., Hashimoto C.;

Thu unusual mosalc protein with a protease domain, encoded by the nudel gene, is involved in defining embryonic dorsoventral polarity in Drosophila.";

Cell 82:788-794(1995).

Cell 82:788-794(1995).

Cascade within the extraembryonic perivitelline compartment which induces dorsoventral polarity of the Drosophila embryo. Nudel is directly involved in locally producing the Toll ligand.

CHENCELMULAR EXCATION: Extracellular matrix.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       This SWISS-PROT entry is copyright. "The sen1(+) gene of Schizosaccharcmyces pombe, a homologue of budding yeast SENI, encodes an RNA and DNA helicase.";
Biochemistry 38:14697-14710(11999).
-!- FUNCTION: Binds to DNA and RNA and has a 5'->3' endonuclease activity. Has a role in tRNA, mRNA, and snoRNA splicing.
-!- SUBDUIT: Monomer.
-!- SUBDUIT: Monomer.
-!- SUBGELIOLAR LOCATION: Nuclear (Potential).
-!- SIMILARITY: Belongs to the DNA2/NAM7 helicase family.
                                                                                                                                                                                                                                                                                                                                                            Gaps

-!- FUNCTION: Catalyzes a salvage reaction resulting in the formation of AMP, that is energically less costly than de novo synthesis.
-:- CATALYTIC ACTIVITY: AMP + diphosphate = adenine + 5-phospho-

"Evidence for lateral gene transfer between Archaea and Bacteria from
genome sequence of Thermotoga maritima.";
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    -!- SUBUNIT: Part of the 30S ribosomal subunit. Contacts proteins S4 and S8 [By similarity).
-!- DOMAIN: The N-terminal domain interacts with the head of the 30S subunit; the C-terminal domain interacts with the body and contacts protein S4. The interaction surface between S4 and S5 is involved in control of translational fidelity.
-!- SIMILARITY: Contains 1 S5 DRBM domain.
-!- SIMILARITY: Belongs to the S5P family of ribosomal proteins.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Gaps

Submitted (AUG-2002) to the BMBL/GenBank/DDBJ databases.
-!- FUNCTION: Catalyzes a salvage reaction resulting in the formation of AMP, that is energically less costly than de novo synthesis.
-!- CATALYTIC ACTIVITY: AMP + diphosphate = adenine + 5-phospho-alpha-D-ribose 1-diphosphate.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  "Sequence of the genes secD, secF and apt from Streptomyces galbus

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             -1- PATHWAY: Purine salvage.
-1- SUBUNIT: Homodimer (By similarity).
-1- SUBCELLULAR LOCATION: Cytoplasmic.
-1- SIMILARITY: Belongs to the purine/pyrimidine phosphoribosyltransferase family.

1- FUNCTION: Catalyzes the conversion of PGHZ to PGDZ, a potent inhibitor of platelet aggregation. Involved in a variety of CNS functions, such as sedation, NREM sleep and PGEZ-induced allodynia, and may have an anti-apoptotic role in oligodendrocytes. Binds small non-substrate lipophilic molecules, including biliverdin, bilirubin, retinal, retinoic acid and thyroid hormone, and may act as a scavenger for harmful hydrophopic molecules and as a scavenger for harmful hydrophopic molecules and as a scavenger for harmful maintenance of the blood-brain, blood-retina, blood-aqueous humor and blood-testis barrier. It is likely to play important roles in both maturation and maintenance of the central nervous system and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              This SWISS-PROT entry is copyright.                                                                                                                                                                                                                                                                                                                                                                       male reproductive system (By similarity).

CATALYTIC ACTIVITY: (52,13E)-(15S)-9-alpha,11-alpha-epidioxy-15-hydroxyprosta-5,13-dienoate = (52,13E)-(15S)-9-alpha,15-dihydroxy-11-oxoprosta-5,13-dienoate.

SUBCELLULAR LOCATION: Detected on rough endoplasmic reticulum of
spatial and temporal delay between messenger RNA and protein
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      arachnoid and menigione cells. Localised to the nuclear envelope, of olgi apparatus, secretory vesicles and spherical cytoplasmic structures in arachnoid trabecular cells, and to circular cytoplasmic structures in meningeal macrophages and perivascular microglial cells. In oligodendrocytes, localised to the rough endoplasmic retirolum and muclear envelope. In retiral pigment epithelial cells, localised to distinct cytoplasmic domains including the perinuclear region. Also secreted (By similarity). TSSUB SPECIFICITY: In the male reproductive system, it is expressed in the testis and epididymas, and is secreted into the seminal fluid.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           BY SIMILARITY.

Displays an emission peak at 470 nM (blue light). Trace amounts of calcium ion trigger the intramolecular oxidation of the chromophore, coelenterazine into coelenteramide and CO(2) with the concomitant emission of light.

-I-PTM: The reduction of the disulfide bond is necessary to regenerate acquorin from aposequorin.

-I-SIMILARITY: BELONGS TO THE EF-HAND SUPERFAMILY. AEQUORIN FAMILY.
-I-SIMILARITY: Contains 3 EF-hand calcium-binding domains.

McGuire W.L., Darbon J.-M.;

"The 28-kDa protein whose phosphorylation is induced by protein kinase
C activators in MCF-7 cells belongs to the family of low molecular
mass hear shock proteins and is the estrogen-regulated 24-kDa
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   PURCEIL CARM. 268:15168-15173(1993).

-1- FUNCTION: INVOLVED IN STRESS RESISTANCE AND ACTIN ORGANIZATION.
-1- SUBUNIT: Associates with alpha- and beca-tubulin and microtubules.
-1- SUBCELLULAR LOCATION: Cytoplasmic in interphase cells. Colocalizes with mitotic spindles in mitotic cells. Translocates to the nucles during heat shock.
-1- INDUCTION: EXPRESSED IN RESPONSE TO ENVIRONMENTAL STRESSES SUCH AS HEAT SHOCK, OR ESTROGEN STIMULATION IN MCF-7 CELLS.
-1- PTM: Phosphorylated in MCF-7 cells on exposure to protein kinase C activators and heat shock.
-1- SIMILARITY: Belongs to the small heat shock protein (HSP20)

-!- FINCTION: Transaldolase is important for the balance of metabolites in the pentose-phosphate pathway (By similarity).
-!- CATALYTIC ACTIVITY: Sedoheptulose 7-phosphate + D-glyceraldehyde.
-!- PATHWAY: Pentose pathway; nonoxidative part.
-!- RATHWAY: Pentose phosphate pathway; nonoxidative part.
-!- SUBCELLULAR LOCATION: Cytoplasmic (Probable).
-!- SIMILARITY: Belongs to the transaldolase family. Subfamily 3B.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Takami H., Nakasone K., Takaki Y., Maeno G., Sasaki R., Masui N.,

Publication No. US20040034888A1

GENERAL INFORMATION:

APPLICANT: Liu, Jinadong

APPLICANT: Zhou, Yihua

APPLICANT: Screen, Steven E

APPLICANT: Tabaska, Jack B

APPLICANT: Gao, Yongwei

TITLE OF INVENTION: Nucleic Acid Molecules and Other Molecules Associated With

TITLE OF INVENTION: Plants and Uses Thereof for Plant Improvement

TITLE OF INVENTION: NUMBER: US/10/425,114

CURRENT FILING DATE: 2003-04-28

CURRENT FILING DATE: 2003-04-28

SEQ ID NO 43085

LENGTH: 440
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     ó
